#### Aim:

Write a java program to demonstrate operator precedence and associativity Source Code:

```
OperatorPrecedence.java

import java.util.*;
public class OperatorPrecedence {
    public static void main(String args[]){
        int x,result;
        System.out.print("Enter a num: ");
        Scanner sc=new Scanner(System.in);
        x=sc.nextInt();
        result=x++ +x++*--x/x++ - --x+3>> 1|2;
        System.out.println("The operation going is x++ + x++ * --x / x++ - --x + 3 >> 1 | 2");
        System.out.println("result = "+result);
    }
}
```

#### Execution Results - All test cases have succeeded!

```
Test Case - 1

User Output

Enter a num:
4

The operation going is x++ + x++ * --x / x++ - --x + 3 >> 1 | 2

result = 3
```

```
Test Case - 2

User Output

Enter a num:
-3

The operation going is x++ + x++ * --x / x++ - --x + 3 >> 1 | 2

result = 2
```

Aim:

write a java program that uses if-else control statement and print the result Source Code:

```
Control.java
import java.util.*;
class Control {
        public static void main(String arg[]){
               Scanner sc = new Scanner (System.in);
               System.out.print("Enter first num : ");
                int x = sc.nextInt();
                System.out.print("Enter second num : ");
                int y = sc.nextInt();
                int z= x+y;
               if(z-20>0)
                {
                       System.out.println("x + y is greater than 20");
               }
               else
               System.out.println("x + y is less than 20");
        }
}
```

# Execution Results - All test cases have succeeded!

```
Test Case - 1
User Output
Enter first num :
Enter second num :
x + y is less than 20
```

Test Case - 2
User Output
Enter first num :
24
Enter second num :
10
x + y is greater than 20

Exp. Name: Sample Program to demonstrate S.No: 3 Date: 2023-09-27 constructor

#### Aim:

Write a program to demonstrate constructor class Source Code:

```
Student.java
import java.util.*;
class Student{
        int id;
        String name;
        void display() {System.out.println(id+" "+name);}
        public static void main(String arg[]){
                Student s1=new Student();
                Student s2=new Student();
                s1.display();
                s2.display();
        }
}
```

#### Execution Results - All test cases have succeeded!

```
Test Case - 1
User Output
0 null
0 null
```

Exp. Name: Sample program to demonstrate destructor

Date: 2023-09-27

#### Aim:

Write a program to demonstrate destructor class Source Code:

```
{\tt DestructorExample.java}
```

**User Output** 

Inside the main() method

Object is destroyed by the Garbage Collector

```
public class DestructorExample
public static void main(String arg[]){
        DestructorExample de = new DestructorExample();
        de.finalize();
        de=null;
        System.gc();
        System.out.println("Inside the main() method");
protected void finalize()
{
        System.out.println("Object is destroyed by the Garbage Collector");
}
}
```

#### Execution Results - All test cases have succeeded!

# Test Case - 1 Object is destroyed by the Garbage Collector

#### Aim:

Write Java program on use of Inheritance.

Create a classVehicle

- contains the data members **color** of String type and **speed** and **size** of integer data type.
- write a methodsetVehicleAttributes() to initialize the data members

Create another classCarwhich is derived from the classVehicle

- · contains the data membersccandgearsofintegerdata type
- write a methodsetCarAttributes()to initialize the data members
- · write a methoddisplayCarAttributes() which will display all the attributes.

Write another class InheritanceDemo with **main()** it receives five arguments **color**, **speed**, **size**, **cc** and **gears**. **Source Code**:

```
InheritanceDemo.java
import java.util.*;
class Vehicle {
        String color;
        int speed, size;
        void setVehicleAttributes(String c,String sp,String s) {
                color=c;
                size=Integer.parseInt(s);
                speed=Integer.parseInt(sp);
class Car extends Vehicle{
        int cc, gears;
        void setCarAttributes(String c,String sp,String s,String cce,String gear){
                setVehicleAttributes(c,sp,s);
                cc=Integer.parseInt(cce);
                gears=Integer.parseInt(gear);
        }
        void displayCarAttributes() {
                System.out.println("Color of Car : "+color);
                System.out.println("Speed of Car : "+speed);
                System.out.println("Size of Car : "+size);
                System.out.println("CC of Car : "+cc);
                System.out.println("No of gears of Car : "+gears);
}
class InheritanceDemo {
        public static void main(String args[]){
                Car s =new Car();
                s.setCarAttributes(args[0],args[1],args[2],args[3],args[4]);
                s.displayCarAttributes();
}
```

# Execution Results - All test cases have succeeded!

Test Case - 1
User Output
Color of Car : Blue
Speed of Car : 100
Size of Car : 20
CC of Car : 1000
No of gears of Car : 5

	Test Case - 2
User Output	
Color of Car : Orange	
Speed of Car : 120	
Size of Car : 25	
CC of Car : 900	
No of gears of Car : 5	

ID: 224G1A3377 Page No: 16

#### Aim:

write a java program to prevent inheritance using abstract class.

- Create an abstract class Shape
- Create a class Rectangle which extends the class Shape
- Class Rectangle contains a method **draw** which prints **drawing rectangle**
- Create another class circle1 which extends Shape
- · Class circle1 contains a method draw which prints drawing circle
- Create a main class TestAbstraction1
- · Create object for the class circle1 and called the method draw

#### Source Code:

```
TestAbstraction1.java
abstract class Shape {
        abstract void draw();
}
class Rectangle extends Shape {
        void draw() {
                System.out.println("drawing rectangle");
}
class Circle1 extends Shape {
        void draw() {
                System.out.println("drawing circle");
class TestAbstraction1 {
       public static void main(String args[]){
       Circle1 c=new Circle1();
       c.draw();
       }
```

# Execution Results - All test cases have succeeded!

# Test Case - 1 User Output drawing circle

write a program on dynamic binding

# Source Code:

```
Demo.java

class Human {
    public void walk() {
        System.out.println("Human walks");
    }
} class Demo extends Human {
    public void walk() {
        System.out.println("Boy walks");
    }
    public static void main(String args[]){
        Human obj1=new Demo();
        Human obj2=new Human();
        obj1.walk();
        obj2.walk();
    }
}
```

#### Execution Results - All test cases have succeeded!

Test Case - 1
User Output
Boy walks
Human walks

#### Aim:

Write a program on method overloading Source Code:

#### Execution Results - All test cases have succeeded!

```
Test Case - 1

User Output

a
a 10
```

ID: 224G1A3377 Page No: 19

#### Aim:

Write a program on method overriding Source Code:

#### Bike.java

```
class Vehicle {
    void run() {
        System.out.println("Bike");

}
class vehicle2 extends Vehicle {
    void run(){
        System.out.println("Bike is running");
    }
}
class Bike extends Vehicle {
    void run() {
        System.out.println("Bike is running safely");

    }

public static void main(String args[]){
        Bike b=new Bike();
        b.run();

}
```

#### Execution Results - All test cases have succeeded!

# Test Case - 1 User Output Bike is running safely

Srinivasa Ramanujan Institute of Technology 2022-2026-CSM-B

ID: 224G1A3377 Page No: 20

#### Aim:

Write a Java program that implements an interface.

Create an interface called <code>Car</code> with two abstract methods <code>String getName()</code> and <code>int getMaxSpeed()</code>. Also declare one <code>default</code> method <code>void applyBreak()</code> which has the code snippet 

System.out.println("Applying break on " + getName());

```
In the same interface include a static method <u>Car getFastestCar(Car car1, Car car2)</u>, which returns car1 if the maxSpeed of car1 is greater than or equal to that of car2, else should return car2.
```

Create a class called <a>BMW</a> which implements the interface <a>Car</a> and provides the implementation for the abstract methods <a>getName()</a> and <a>getMaxSpeed()</a> (make sure to declare the appropriate fields to store <a>name</a> and <a>maxSpeed</a> and also the constructor to initialize them).

Similarly, create a class called Audi which implements the interface Car and provides the implementation for the abstract methods **getName()** and **getMaxSpeed()** (make sure to declare the appropriate fields to store **name** and **maxSpeed** and also the constructor to initialize them).

Create a public class called MainApp with the main() method.

Take the input from the command line arguments. Create objects for the classes BMW and Audi then print the fastest car.

#### Note:

Java 8 introduced a new feature called default methods or defender methods, which allow developers to add new methods to the interfaces without breaking the existing implementation of these interface. These default methods can also be overridden in the implementing classes or made abstract in the extending interfaces. If they are not overridden, their implementation will be shared by all the implementing classes or sub interfaces.

Below is the syntax for declaring a default method in an interface:

```
public default void methodName() {
    System.out.println("This is a default method in interface");
}
```

Similarly, **Java 8** also introduced <u>static</u> methods inside interfaces, which act as regular static methods in classes. These allow developers group the utility functions along with the interfaces instead of defining them in a separate helper class.

Below is the syntax for declaring a static method in an interface:

```
public static void methodName() {
    System.out.println("This is a static method in interface");
}
```

```
ID: 224G1A3377 Page No: 22
```

```
q11284/MainApp.java
package q11284;
interface Car {
        public String getName();
        public int getMaxSpeed();
        public default void applyBreak() {
                System.out.println("Applying break on "+getName());
        }
        static Car getFastestCar(Car a,Car b) {
                if(a.getMaxSpeed() > b.getMaxSpeed())
                return a;
                else
                return b;
        }
class BMW implements Car {
        String name;
        int speed;
        BMW(String n,String s) {
                speed=Integer.parseInt(s);
        name=n:
        }
        public String getName() {
                return name;
        public int getMaxSpeed(){
                return speed;
}
class Audi implements Car {
        String name;
        int speed;
        Audi(String n,String s) {
        speed = Integer.parseInt(s);
        name=n;
public String getName() {
return name;
public int getMaxSpeed(){
        return speed;
}
public class MainApp {
        public static void main(String[] args){
               BMW bmw = new BMW(args[0],args[1]);
                Audi audi=new Audi(args[2],args[3]);
                Car max=Car.getFastestCar(bmw,audi);
                System.out.println("Fastest car is : "+max.getName());
        }
```

# Execution Results - All test cases have succeeded!

#### Aim:

Write a Java code for handling the exception.

#### Source Code:

```
q222/handleError.java
package q222;
import java.util.Random;
public class handleError {
        public static void main(String args[]) {
               int a = 0, b = 0, c = 0;
                Random r = new Random(100);
                for(int i=0;i<32;i++)
                {
                        try{
                                b=r.nextInt();
                                c=r.nextInt();
                                a=12345/(b/c);
                       }
            catch(ArithmeticException e){
                System.out.println("Division by zero.");
            System.out.println("a: "+a);
        }
}
```

#### Execution Results - All test cases have succeeded!

Test Case - 1
User Output
a: 12345
Division by zero.
a: 0
a: -1028
Division by zero.
a: 0
a: 12345
a: -12345
Division by zero.
a: 0
a: 3086
a: 12345
a: -12345

Division by zero.

a: 0

Exp. Name: Write the code to create an exception using the predefined exception

Date: 2023-11-08

#### Aim:

Write a Java code to create an exception using the predefined exception Source Code:

```
q223/exception2.java
package q223;
public class exception2{
 public static void main(String args[]){
        int d,a;
        try{
                d=0;
                a=42/d;
        catch(ArithmeticException e){
                System.out.println("Exception raised -Division by zero.");
        System.out.println("After catch statement.");
 }
}
```

#### Execution Results - All test cases have succeeded!

```
Test Case - 1
Exception raised -Division by zero.
```

After catch statement.

S.No: 24	Exp. Name: <i>program to create a super class called</i> Figure that it returns the area of a rectangle and triangle	Date: 2023-12-06
----------	--	------------------

## Aim:

Write a java program to create a super class called Figure that receives the dimensions of two dimensional objects. It also defines a method called area that computes the area of an object. The program derives two subclasses from Figure. The first is Rectangle and second is Triangle. Each of the sub classes override area() so that it returns the area of a rectangle and triangle respectively

## Source Code:

AbstractAreas.java

ID: 224G1A3377 Page No: 38

```
import java.util.*;
abstract class Figure
{
        double dim1,dim2,dim3,dim4;
        Figure(double a,double b)
                dim1=a;
                dim2=b;
                dim3=a;
                dim4=b;
        abstract void area();
class Rectangle extends Figure
{
        Rectangle(double a,double b)
                super(a,b);
        }
        void area()
        {
                double Area=dim1*dim2;
                System.out.println("Rectangle:");
                System.out.println("Area is "+Area);
class Triangle extends Figure
                Triangle(double a,double b)
                        super(a,b);
                }
                void area()

S.No: 25 Exp. Name: Write a Java program demonstrating the usage of Threads

Date: 2023-11-29

## Aim:

Write a Java program that uses three threads to perform the below actions:

- 1. First thread should print "Good morning" for every 1 second for 2 times
- 2. Second thread should print "Hello" for every 1 seconds for 2 times
- 3. Third thread should print "Welcome" for every 3 seconds for 1 times

Write appropriate **constructor** in the <u>Printer</u> class which implements <u>Runnable</u> interface to take three arguments: **message**, **delay** and <u>count</u> of types **String**, **int** and **int** respectively.

Write code in the <a>Printer.run()</a> method to print the <a>message</a> with appropriate <a>delay</a> and for number of times mentioned in <a>count</a>.

Write a class called <a href="https://documents.org/">ThreadDemo</a> with the <a href="main()">main()</a> method which instantiates and executes three instances of the above mentioned <a href="Printer">Printer</a> class as threads to produce the desired output.

[Note: If you want to sleep for 2 seconds you should call [Thread.sleep(2000);] as the [Thread.sleep(...)] method takes milliseconds as argument.]

**Note:** Please don't change the package name. **Source Code:** 

q11349/ThreadDemo.java
